

Summary

Deliverable 9.4 Data Management Plan

WP9

Lead authors: Katerina Toulou (CERTH)

This deliverable presents the initial version of the Data Management Plan. It serves as the initial plan for the collection, organisation, storing and sharing of the knowledge and data created within the project. Any action in the project that is related to data (from collection, generation and processing to distribution, storage, and preservation) is subject to examination and reporting in the Data Management Plan. The document contains the appropriate methodologies, tools and repositories for data management and dissemination of all available information generated by the PANACEA project. Such information includes, but is not limited to, scientific publications produced by the project's consortium members, open-source software components along with their source code, simulation datasets, anonymous driver/ rider/ operator statistics, project deliverables, etc. This deliverable provides to partners templates for conducting a Data Protection Impact Assessment (DPIA) process, for data controllers and processors as well as a spreadsheet with the data characteristics, specifications and embargos.

This Deliverable is a living document which will be continuously adapted depending on the needs of the project research and development objectives and based on the direct input from members of the consortium and PANACEA solution users. At the end of the project, the final DMP version (D9.5) will include a description of the datasets, a decision of embargos and shared data and any other relevant changes and updates.
